

What Overgrown Cedar Is Stealing From Your Land

What Every Central Texas Property Owner Needs to Know

If you own land in Central Texas, cedar and brush are not just sitting there looking ugly.

They are working against you every single day.

What Cedar Actually Does to Your Land

A single mature cedar tree drinks up to 40 gallons of water per day from your soil. A pasture full of cedar is a pasture that cannot grow grass, hold water, or support livestock.

Cedar does not stay where it is. It spreads. One tree becomes ten. Ten become a hundred. What looked manageable five years ago looks like a wall today.

What Overgrown Land Costs You

- **Lost pasture** -- cedar and brush replace native grass. Less grass means less grazing. Less grazing means less land value.
- **Water loss** -- cedar steals water from the soil your grass needs to survive.
- **Fire risk** -- dry cedar burns fast and hot. An overgrown property is a liability every dry season.
- **Property value** -- buyers pay for usable acres. Overgrown acreage does not count.

The Longer You Wait the Harder It Gets

Cedar and brush do not take a break. Every year you wait the root systems get deeper, the spread gets wider, and the job gets bigger.

The landowners who clear early spend less money and get more land back. The ones who wait spend more and get less.

What Your Land Looks Like After

Open sight lines to your fence line. Grass coming back on its own. Land you can walk, work, and take pride in.

A property that looks like what you paid for when you bought it.

One Call Gets It Started

We walk the property with you. We tell you exactly what it needs. We give you a straight price before we touch a thing.

No guessing. No runaround. Just your land back.
