

Why Most Central Texas Build Projects Start Wrong

And How to Make Sure Yours Does Not

You have a project planned. A barn. A shop. A pad for an outbuilding. A home site.

Your contractor is ready. Your timeline is set.

The last thing you need is a site that is not ready -- and the problems that come with it.

What Happens When Site Prep Gets Skipped

Bad drainage is the most common and most expensive problem. When a building pad is not properly graded, water runs toward the structure instead of away from it. That means foundation issues, flooding, and repairs that cost far more than the prep work would have.

Soft spots and uneven ground cause settling. A pad that was not properly cut, filled, and compacted will shift. Doors stick. Floors crack. The structure moves.

Your contractor shows up to a site that is not ready and either handles the prep themselves at a higher rate -- or your timeline slips.

What Good Site Prep Actually Involves

- **Clearing** -- removing brush, stumps, and debris so the ground is workable.
- **Cutting and filling** -- shaping the ground so the pad is level and drains properly.
- **Compaction** -- packing the base so it is stable and does not shift after you build on it.
- **Drainage direction** -- making sure water moves away from your structure, not toward it.

The Cheapest Insurance You Can Buy on a Build

Site prep done right costs a fraction of what foundation repairs and drainage fixes cost after the fact. Do it once. Do it before you build.

What We Handle

We clear the site, cut and fill to the right grade, compact the base, and make sure your pad drains the way it is supposed to.

Your contractor shows up to a site that is ready to go. No delays. No surprises.

Tell Us What You Are Building

Tell us the project and the location. We come out, walk the site, and give you a straight quote before we touch anything.
